Week 2 Assignment Solutions

1. ATM PIN Length Validator

Check that a supplied PIN string has exactly four characters, using length() and a single if/else as requested.

Java Solution

```
public class Main {
    static void checkPinLength(String pin) {
        if (pin.length() != 4) {
            System.out.println("Invalid PIN - must be exactly 4 digits.");
        } else {
            System.out.println("PIN length OK.");
        }
    }

    public static void main(String[] args) {
        checkPinLength("482");
        checkPinLength("4820");
    }
}
```

Sample Output

```
Invalid PIN - must be exactly 4 digits.
PIN length OK.
```

Notes

The question specifically asks for a length check only. This follows that requirement; it does not additionally test whether the four characters are numeric.
