Week 2 Assignment Solutions

3. Product Inventory CSV Parser

Split a CSV line into ProductName, SKU, and Quantity; accept exactly three fields.

Java Solution

```
public class Main {
    static void parseInventoryRecord(String csvLine) {
        String[] fields = csvLine.split(",", -1);

        if (fields.length != 3) {
            System.out.println("Invalid Record");
        } else {
            System.out.println("Product: " + fields[0].trim()
                    + " | SKU: " + fields[1].trim()
                    + " | Qty: " + fields[2].trim());
        }
    }

    public static void main(String[] args) {
        parseInventoryRecord("Wireless Mouse,WM-2201,150");
        parseInventoryRecord("Wireless Mouse,150");
    }
}
```

Sample Output

```
Product: Wireless Mouse | SKU: WM-2201 | Qty: 150
Invalid Record
```

Notes

split(",", -1) retains empty trailing fields, so malformed records with a missing final value are also caught by the exact three-field check.
