Week 2 Practice Problem Solutions

1. Vowel & Consonant Counter

Count vowels and consonants in a string containing letters and spaces, ignoring spaces.

Java Solution

```
public class Main {
    static void countVowelsAndConsonants(String text) {
        int vowels = 0;
        int consonants = 0;

        for (int i = 0; i < text.length(); i++) {
            char ch = Character.toLowerCase(text.charAt(i));
            if (ch == ' ') {
                continue;
            }
            if (ch == 'a' || ch == 'e' || ch == 'i'
                    || ch == 'o' || ch == 'u') {
                vowels++;
            } else {
                consonants++;
            }
        }
        System.out.println("Vowels: " + vowels
                + " | Consonants: " + consonants);
    }

    public static void main(String[] args) {
        countVowelsAndConsonants("Java Programming");
    }
}
```

Sample Output

```
Vowels: 5 | Consonants: 10
```

Notes

The input assumption says only letters and spaces, so every non-space character that is not a vowel is counted as a consonant.
